Note 6-1: This pin (CS#) is the chip select input connecting to the MCU. The chip is enabled for MCU communication:only when CS# is pulled LOW.

Note 6-2: This pin (D/C#) is Data/Command control pin connecting to the MCU. When the pin is pulled HIGH,the data will be interpreted as data. When the pin is pulled LOW, the data will be interpreted as command.

Note 6-3: This pin (RES#) is reset signal input. The Reset is active low.

Note 6-4: This pin (BUSY) is Busy state output pin. When Busy is high the operation of chip should not be interrupted and any commands should not be issued to the module. The driver IC will put Busy pin high when the driver IC is working such as:

- Outputting display waveform; or
- Communicating with digital temperature sensor

Note 6-5: This pin (BS1) is for 3-line SPI or 4-line SPI selection. When it is “Low”, 4-line SPI is selected.

When it is “High”, 3-line SPI (9 bits SPI) is selected. Please refer to below Table.

**Table: Bus interface selection**

BS1	MPU Interface
L	4-lines serial peripheral interface (SPI)
H	3-lines serial peripheral interface (SPI) - 9 bits SPI

## 6.2 MCU Interface

### 6.2.1 MCU Serial Peripheral Interface (4-wire SPI)

The 4-wire SPI consists of SCLK (serial clock), SDIN (serial data), D/C# and CS#. D0 acts as SCLK and D1 acts as SDIN.

Table -1 : Control pins of 4-wire Serial Peripheral interface

Function	CS# pin	D/C# pin	SCLK pin
Write command	L	L	↑
Write data	L	H	↑

**Note:** ↑ stands for rising edge of signal

SDIN is shifted into an 8-bit shift register in the order of D7, D6, ... D0. The data byte in the shift register is written to the Graphic Display Data RAM (RAM) or command register in the same clock. Under serial mode, only write operations are allowed.

Figure 6-1 : Write procedure in 4-wire Serial Peripheral Interface mode

## 6.2.2 MCU Serial Peripheral Interface (3-wire SPI)

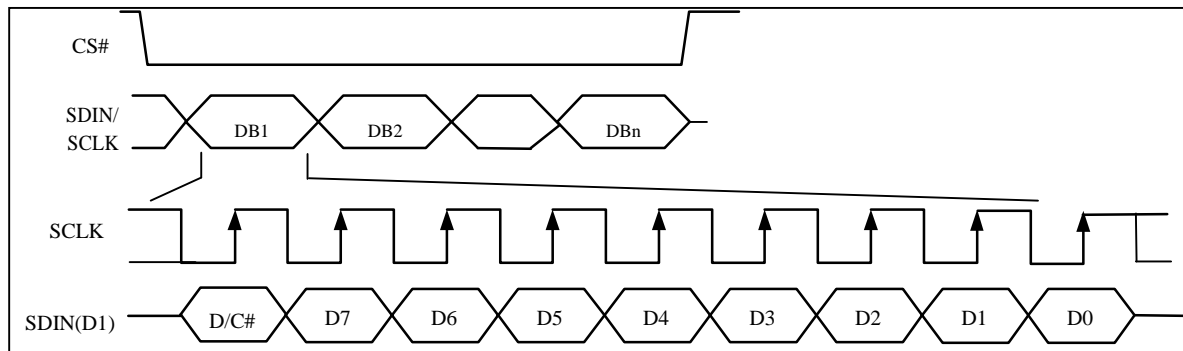

The 3-wire serial interface consists of SCLK (serial clock), SDIN (serial data) and CS#. In SPI mode, D0 acts as SCLK and D1 acts as SDIN. The operation is similar to 4-wire serial interface while D/C# pin is not used. There are altogether 9-bits will be shifted into the shift register in sequence: D/C# bit, D7 to D0 bit. The D/C# bit (first bit of the sequential data) will determine the following data byte in the shift register is written to the Display Data RAM (D/C# bit = 1) or the command register (D/C# bit = 0). Under serial mode, only write operations are allowed.

Table -2 : Control pins of 3-wire Serial Peripheral interface

Function	CS# pin	D/C# pin	SCLK pin

Write data	L	Tie LOW	↑

**Note:** ↑ stands for rising edge of signal

### 6.3 External Temperature Sensor operation

There are two ways to let the module get the ambient temperature,

- 1) use the external temperature sensor interface, The module provides two I/O lines [TSDA and TSCL] for connecting digital temperature sensor for temperature reading sensing. TSDA will be treated as SDA line and TSCL will be treated as SCL line. They are required connecting with the external pull-up resistors when they are used to connect to the temperature sensor, then the module will check the temperature automatically.
- 2) use any kinds of external temperature sensor to get the temperature value then converted to hex format, then use the spi interface send command 0x1A and the temperature value into the module. The temperature value how to converted to hex as the follow:

1. When the Temperature value MSByte bit D11 = 0, the temperature is positive and value (DegC) = + (Temperature value)/16
2. When the Temperature value MSByte bit D11 = 1, the temperature is negative and value (DegC) = ~ (2's complement of Temperature value)/16

## 14.2 Definition of contrast ratio

The contrast ratio (CR) is the ratio between the reflectance in a full white area (R1) and the reflectance in a dark area (Rd)():

R1: white reflectance      Rd: dark reflectance

$$CR = R1/Rd$$

## 14.3 Reflection Ratio

The reflection ratio is expressed as :

$$R = \text{Reflectance Factor white board} \times (L_{\text{center}} / L_{\text{white board}})$$

L center is the luminance measured at center in a white area (R=G=B=1) . L white board is the luminance of a standard white board . Both are measured with equivalent illumination source . The viewing angle shall be no more than 2 degrees .

## 15 HANDLING , SAFETY AND ENVIROMENTAL REQUIREMENTS

### WARNING

The display glass may break when it is dropped or bumped on a hard surface. Handle with care. Should the display break, do not touch the electrophoretic material. In case of contact with electrophoretic material, wash with water and soap.

### CAUTION

The display module should not be exposed to harmful gases, such as acid and alkali gases, which corrode electronic components.

Disassembling the display module can cause permanent damage and invalidate the warranty agreements.

IPA solvent can only be applied on active area and the back of a glass. For the rest part, it is not allowed.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged . Moreover the display is sensitive to static electricity and other rough environmental conditions.

### Mounting Precautions

(1) It`s recommended that you consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the module.

(2) It`s recommended that you attach a transparent protective plate to the surface in order to protect the EPD. Transparent protective plate should have sufficient strength in order to resist external force.

(3) You should adopt radiation structure to satisfy the temperature specification.

(4) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the PS at high temperature and the latter causes circuit break by electro-chemical reaction.

(5) Do not touch, push or rub the exposed PS with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of PS for bare hand or greasy cloth. (Some cosmetics deteriorate the PS)

(6) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach the PS. Do not use acetone, toluene and alcohol because they cause chemical damage to the PS.

(7) Wipe off saliva or water drops as soon as possible. Their long time contact with PS causes deformations and color fading.

Product specification

The data sheet contains final product specifications.

**Limiting values**

Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information**

Where application information is given, it is advisory and does not form part of the specification.

**Product Environmental certification**

ROHS

**REMARK**

All The specifications listed in this document are guaranteed for module only. Post-assembled operation or component(s) may impact module performance or cause unexpected effect or damage and therefore listed specifications is not warranted after any Post-assembled operation.
